CAMPAIGN LIVE

INDOOR-SAFE

OPEN-HARDWARE CORE

MODULAR

HOT-SWAP BATTERIES

SkyCue — A fleet of camera drones. One operator. Cinema shots for your wedding.

Replace a 15-person camera crew with a swarm of smart drones that swing to crane angles the moment a guest speaks into a microphone pod at their seat. Weddings, anniversaries, concerts — captured like a Hollywood production.

01 / HOW IT WORKS

One operator. A choreographed crew.

Before your event, every camera angle is pre-mapped. On the day, a microphone pod at each seat — or a single button press — sends the nearest free drone to its pre-programmed shot. The drones don't wander; they perform.

FEATURE 01

Trigger Pods

Small omni-directional microphone pods sit at every focal seat — think head table, altar, lectern. When a guest speaks or presses the

FEATURE 02

Pre-Production Mapping

Before the event, operator and client use CuTTo to map every camera angle, flight path, and focus point into a venue profile.

340% funded · \$412,390 pledged

23 days left

Back this project

Multiple angles can be live-streamed, too.

FEATURE 03

Indoor Positioning — The Moat

Four to six UWB anchor beacons set up in venue corners give each drone absolute 3D position indoors — around 10 cm accuracy, fused with optical flow and IMU. Film studios pay six figures for this. SkyCue delivers it at parts cost. Outdoors: GPS/RTK. This is what no competitor offers: **cinematic indoor drone coverage**.

FEATURE 04

Two Modular Drone Models

Vantage — the smallest drone that still shoots beautiful video. Enclosed prop guards for indoor safety, quieter profile.

Meridian — the pro heavy lifter: folding frame, RTK GPS, 3-axis cinema gimbal. One system that grows from a Vantage Starter to a full Wedding Duo.

FEATURE 05

Battery, Handled

Each drone hot-swaps batteries in seconds; the ground station keeps 6–8 packs topped up per drone. Low-battery alert → operator taps “recall.” Or the drone auto-lands on its pad at a safe threshold on its own — even mid-toast, even if you’re looking the other way. Eight hours of coverage comes from swapping, not from one impossible battery.

FEATURE 06

Open-Source / Open-Hardware Core

Built on ArduPilot, OpenHD (sub-100 ms video), Skybrush, and STorM32 gimbal tech. Zero license fees, endlessly hackable. The proprietary magic is the orchestration layer: pod→drone dispatch, the CuTTo planner, and the streaming stack. We’re honest about what we built — and what we stand on.

03 / BATTERY, HANDLED

Eight hours of coverage. Zero battery drama.

Eight hours of coverage doesn't come from one impossible battery — it comes from smart swapping and a failsafe designed for the moments when you can't be watching.

Hot-Swap in Seconds

The ground station keeps 6–8 packs per drone topped up at all times. Swap takes seconds — the drone is back in the air before the speech ends.

Low-Battery Alert

The operator receives a clear low-battery alert on the Live Orchestrator. A single tap sends the drone home on its own power while a fresh aircraft takes the shot.

Auto-Land Failsafe

At a safe battery threshold, the drone **lands itself on its landing pad automatically** — even mid-toast, even if the operator is distracted. No crash, no drama, no interruption to the moment.

Full Failsafe Cascade

GCS signal loss → battery low → geofence breach → auto-land on pad. Four independent layers. Any one of them brings the aircraft home safely before anything goes wrong.

04 / CUTTO SOFTWARE

Pre-production to final cut. Your client is part of it.

CuTTo is the software suite that turns pre-production chaos into a shared, structured plan — and turns post-production revision hell into a single structured pass.

01

Venue Planner

Photographer surveys the venue once with a drone or 360° camera. CuTTo builds a textured 3D model — a “satellite Google Maps” view of the ballroom. Your client logs in, draws flight paths on the model, picks camera angles (altitude, yaw, tilt), sets focus points, ties shots to seat pods, and sees a preview render of each angle. You review it, flag issues, suggest shots they didn’t think of. Client confirms before the event date. Everyone shows up knowing exactly what’s happening.

02

Collaborative Edit

After the event, your client reviews every angle for every moment — toast, first dance, vows — stars or rejects takes, picks hero angles, and approves a highlight cut with timestamped inline comments. One structured pass instead of twelve emails and three Dropbox folders. You deliver faster; they feel heard.

03

Live Orchestrator

The operator’s control surface on event day: touchscreen or laptop interface showing fleet telemetry, battery rotation schedule, failsafe status, live multiview of all active drone feeds, and one-tap dispatch overrides. You’re the conductor of a silent camera crew — one screen, every flight.

[PLACEHOLDER – CUTTO VENUE PLANNER INTERFACE SCREENSHOT]

05 / LUMIÈRE

Live stream. Video wall. Every seat, the best seat.

LUMIÈRE is three upsells in one package: remote guests who couldn’t travel watch live, in-room guests with bad sight lines get a front-row view, and the video wall becomes part of the experience.

REMOTE GUESTS

Private Live Stream

One private link, any device, no app required. Family who couldn’t travel watches live from anywhere in the world. Auto-recorded with replay. Approximately 5-second latency via cloud — smooth, reliable, personal.

VIDEO WALL

In-Room Video Wall

Optional 43–55” panels in the room. Layouts your client can choose: a grid of remote guests’ faces with a virtual glass-clink to speak — the remote guest clinks, appears in a dedicated toast slot with audio. Or per-table monitors where a virtual guest chats directly with that table via WebRTC. Or a fully custom layout.

SIGHT-LINE FEEDS

In-Venue Sight-Line Feeds

Same live feed, second path. Any tablet or smart TV at a table runs the live viewer as a web app — zero extra hardware required. Or

web app — zero extra hardware required. Or optional 24–32” panels. Guests with a pillar in their way watch the ceremony on the screen in front of them at under 1-second latency on the venue’s own LAN — no internet needed for this path.

[PLACEHOLDER — LUMIÈRE LAYOUT DIAGRAM: REMOTE STREAM + VIDEO WALL + SIGHT-LINE FEED PATHS]

”Half your guests can’t see the ceremony from those seats — give them the best seat in the house on the screen in front of them.”

Local-first streaming (WebRTC SFU on the operator’s ground hub) means a weak venue uplink never degrades the in-room experience. The room works even if the internet doesn’t.

06 / HALCYON

The deliverables. All of them, in one place.

Halcyon is every way the day lives on — the film your couple watches on anniversaries, the book that sits on the coffee table, the gallery they share with their parents.

07 / OWN IT OR LEASE IT

Four routes to owning a SkyCue system.

Whether you’re testing the market or building a franchise, there’s a path that fits your business — with insurance, firmware, and support included at every level.

PROGRAM	WHO IT'S FOR	TERMS	PRICE
Per-Event Rental	Curious pros & one-off gigs	1–3 days, kit shipped, insurance included	\$350–600/ event (Vantage Starter) \$850–1,200/ event (Wedding Duo)
Lease-to-Own	Pros building a kit	12 or 24 mo. 50–60% of payments credit toward purchase. Cancel anytime. Insurance + firmware upgrades included.	\$200–350/mo (Vantage) \$400–600/mo (Meridian) \$900–1,400/ mo (Duo)
Certified Partner	Committed pros	Buy kit + mandatory SkyCue safety certification + CuTTo	Kit price + \$49–99/mo

		software license. Beta firmware ring, support, and referral credits included.	software license
Franchise-Lite	Established studios	Regional exclusivity + kit(s) + certification + CuTTo subscription + revenue share on software and streaming add-ons	\$25,000 + 8–12% of add-on revenue

OPERATOR ECONOMICS

A partner booking **6 events per month** at a cinematic multi-angle package rate of **\$4,000–6,000 per event** grosses **\$24,000–36,000/month** against a lease cost of \$1,000–1,400. The lease pays for itself in a single premium booking. Community telemetry — auto bug reporting, beta firmware ring, feedback portal, referral credits — turns every rental into R&D and every partner into a salesperson.

08 / SAFETY & TRUST

The safest seat in the room is under the drone.

Drone safety is the first question skeptics ask. We built our answer into the hardware, the software, the training, and the insurance — not just the marketing.

FAA Part 107 Certified

Every SkyCue operator holds FAA Part 107 certification (or regional equivalent), plus completes a SkyCue safety and SOP course with a hands-on checkride before ever flying a paid event.

No Flight Over Crowds

Drones fly around and above guests — never directly over a crowd. Enclosed prop guards protect against incidental contact. Hard geofences — ceiling + venue polygon — are locked before the event begins and cannot be overridden in the air.

Full Failsafe Cascade

Four independent layers: GCS signal loss → battery low → geofence breach → auto-land on pad. Each triggers automatically. The aircraft never needs the operator to save it.

Remote ID Broadcasting

All SkyCue aircraft broadcast Remote ID in compliance with FAA requirements, giving authorities full situational awareness at any event.

\$1M+ Liability Insurance

All pilot units carry liability insurance of \$1M or more, plus hull and payload coverage. Venues are named as additional insured on the policy. Per-event rental coverage is included in the rental rate.

Privacy by Contract

A venue permission contract is required before any survey or event flight. Entry signage notifies guests. All footage is held exclusively by the licensed operator under contract — not SkyCue.

09 / STRETCH GOALS

The more you back, the more everyone gets.

Stretch goals unlock in order. At **\$412,390** pledged, S1 is already yours.

11 / FAQ

Questions we'd ask too.

Is this legal at events like weddings?

How does it know where to fly indoors — without GPS?

What if a battery gets low while I’m busy — will the drone crash?

What cameras does it carry?

Can I rent instead of buy?

When do I get mine?

12 / ABOUT THE MAKER

Built by someone who’s worked the camera.

SkyCue is a Kickstarter campaign. All product names, specifications, pricing, and delivery dates are accurate as of the campaign launch date and subject to change. Delivery dates are estimates and depend on manufacturing and logistics. SkyCue drones are operated by FAA Part 107 certified pilots or regional equivalent. Indoor drone operation requires venue permission. All operators carry liability insurance. Remote ID compliance required in the US, Canada, and the UK. SkyCue is not affiliated with or endorsed by Blackmagic Design or Sony. ArduPilot, OpenHD, Skybrush, and STorm32 are open-source projects used under their respective licenses. Kickstarter campaign subject to Kickstarter's terms of use. US & EU fulfillment; additional regions may be added. © 2026 SkyCue. All rights reserved.

[Founder Name] CUTTO • VANTAGE • MERIDIAN • LUMIÈRE • HALCYON
FOUNDER, SKYCUE

[PLACEHOLDER — Founder bio: background in cinematography, event photography, or drone technology. How you first saw a wedding crew of fifteen people struggling to capture the moment. The moment you realised the answer was a smarter system, not more people. What you built first, what broke, what you learned, and why you believe SkyCue is ready. Keep it honest, specific, and human — this is the paragraph a sceptical couple reads before they decide whether to trust you with the most important day of their lives.]

[PLACEHOLDER — Second paragraph: your technical background, open-source community involvement, or previous hardware projects. Reference the ArduPilot / OpenHD

community if you've contributed. Name any advisors, co-founders, or key collaborators here.]
